PART 5 — 50 READY-TO-USE PROMPTS

- 20. Business Prompts (1–10)
- 21. Writing Prompts (11–20)
- 22. Marketing Prompts (21–30)
- 23. Productivity Prompts (31–40)
- 24. Creative Prompts (41–50)

INTRODUCTION: Why Most People Get Mediocre Results From AI

Here is the uncomfortable truth: the AI tool is not the problem. Two people can use the exact same AI, ask the exact same question, and get completely different results. The difference is the prompt.

Most people treat AI like a search engine. They type a short question, accept the first answer, and move on. That is like buying a sports car and never leaving first gear.

The people getting extraordinary results — the ones writing entire marketing campaigns in an afternoon, researching competitors in minutes, automating hours of busywork — are not using a secret AI. They are using secret techniques. This guide contains those techniques.

You do not need to be technical. You do not need to code. You need to know how to talk to the AI in a way that unlocks what it can actually do. By the end of this guide, you will.

How to use this guide: Read Part 1 carefully — it is the foundation. Parts 2 and 3 build on it. Part 4 shows you how to turn these skills into money. Part 5 is your copy-paste arsenal. Keep it open next to you when you work.

PART 1 — PROMPT ENGINEERING SECRETS

Chapter 1: Chain-of-Thought Prompting — Make the AI Show Its Work

The secret

When you ask AI a question, it normally jumps straight to an answer. The problem: for anything complex — math, logic, business decisions, strategy — jumping straight to the answer produces worse answers. The AI "guesses" instead of reasoning.

Chain-of-thought prompting fixes this with one simple instruction: **ask the AI to reason step by step before answering.**

This is the single highest-leverage technique in this entire guide. It costs you eleven words and can double the quality of complex outputs.

Why it works

Large language models generate text one piece at a time. When you force the model to write out its reasoning first, it literally gives itself more "thinking room." Each reasoning step becomes context for the next step, so errors get caught and corrected mid-stream — the same way you would catch your own mistake if you wrote out your math homework instead of guessing.

How to do it

Add one of these phrases to any complex prompt:

- "Think through this step by step before giving your final answer."
- "Show your reasoning step by step, then give the final answer."
- "Work through this carefully, one step at a time."

Example: pricing a product

Weak prompt:

> What should I price my handmade candles at?

Chain-of-thought prompt:

> I sell handmade soy candles. Each candle costs me $4.50 in materials, $1.20 in packaging, and takes 25 minutes to make (I value my time at $20/hour). Etsy takes 6.5% transaction fee plus $0.20 listing fee. I want a 40% profit margin on total cost. Think through this step by step — calculate material cost, labor cost, fees, then the target margin — and show each calculation before giving me the final recommended price.

The second version forces the AI to do real arithmetic in the open, where you can verify it, instead of blurting out "$15" with no basis.

Example: business decision

> I'm deciding whether to raise my eBay prices by 10% or keep them the same and increase volume through promoted listings. My current margin is 35%, my conversion rate is 2.1%, and promoted listings cost 5% of sale price. Walk through the math step by step for both scenarios on 100 sales per month at $30 average price, then recommend which option gives higher total profit.

Advanced variation: self-check

After the AI gives a step-by-step answer, add:

> Now review each step above for errors. If you find any mistake, correct it and give me the revised final answer.

This creates a verification loop that catches the AI's own arithmetic and logic slips. Use it for anything involving numbers, dates, or multi-step logic.

When to use it

Use chain-of-thought for: calculations, comparisons, planning, strategy, troubleshooting, legal/financial reasoning, and any question where a wrong answer costs you money. Skip it for simple creative tasks (writing a product title does not need step-by-step reasoning).

Chapter 2: Few-Shot Prompting — Teach by Example

The secret

AI models are pattern-matching machines. Instead of describing what you want, **show** the AI 2–3 examples of exactly what you want, and it will continue the pattern with remarkable accuracy.

This is called "few-shot" prompting (few = a small number of examples, shot = attempt). It is how professionals get consistent, on-brand output without writing a page of instructions.

Why it works

Descriptions are ambiguous. "Write in a friendly tone" means different things to different people. But three examples of your friendly tone remove all ambiguity — the AI copies the pattern: sentence length, word choice, energy, formatting. Pattern beats prescription every time.

How to do it

Structure your prompt like this:

```
[Brief instruction]
Example 1:
Input: [sample input]
Output: [exactly the output style you want]
Example 2:
Input: [sample input]
Output: [exactly the output style you want]
Now do the same for:
Input: [your real input]
Output:
```

Example: eBay titles in your style

```
I need eBay product titles. Here are two examples of my preferred style:

Example 1:
Product: wireless earbuds
Title: Sony WF-1000XM5 Wireless Noise Canceling Earbuds - Black - Excellent Condition

Example 2:
Product: coffee maker
Title: Breville Barista Express Espresso Machine BES870XL - Stainless - Tested Works

Now write a title in the same style for:
Product: vintage film camera, Canon AE-1, 50mm lens included
```

The AI will mirror your exact formula: Brand + Model + Key Features + Condition note. Two examples taught it more than a paragraph of instructions could.

Example: customer service replies

```
Rewrite customer messages into professional replies. Follow this pattern:

Example 1:
Customer: "wheres my package its been a week"
Reply: "Thanks for reaching out! I checked your tracking and your package is currently in transit — it's scheduled to arrive by Thursday. I'll keep an eye on it and update you if anything changes."

Example 2:
Customer: "this isnt what i ordered i want refund"
Reply: "I'm sorry about the mix-up — that's not the experience I want you to have. I've started your refund now, and you'll see it within 3–5 business days. If you'd like, I can also ship the correct item right away at no extra charge."

Now reply to:
Customer: "the box came damaged can u send another"
```

Pro tips

- **2–3 examples is the sweet spot.** One example can be a fluke; five is overkill and wastes tokens.
- **Make examples diverse.** If all your examples are short products, the AI will struggle with a long one. Vary them.
- **Use your real voice.** The best examples are your own past outputs, lightly cleaned up — not idealized versions you would never actually write.
- **Few-shot beats long instructions** for style, tone, formatting, and structure. Use long instructions for content rules (what to include) and few-shot for style (how it should sound).

Chapter 3: Role-Based Prompting — Unlock Expert Modes

The secret

Start your prompt by telling the AI who to be. "You are a [role]" activates a completely

different quality of response than a bare question.
This works because the AI was trained on text written by millions of specialists. When you assign a role, you steer it toward the vocabulary, frameworks, and judgment patterns of that profession.

Why it works

Compare these two prompts:

```
How do I improve my eBay listings?
```

vs.

```
You are an eBay Top Rated Seller with 12 years of experience and 40,000+ feedback. You specialize in listing optimization and conversion rate improvement. Audit my approach and tell me exactly what to change: [paste listing]
```

The second prompt does not just change the tone — it changes the substance. The AI draws on seller-specific knowledge: Cassini search behavior, conversion benchmarks, photo sequencing, pricing psychology. Same AI, different expert.

The formula

```
You are a [specific role] with [credentials/experience].
Your specialty is [narrow expertise].
[Your task, with context.]
```

Specificity matters. "You are a marketer" is weak. "You are a direct-response copywriter who specializes in eBay listings for refurbished electronics" is strong.

Power roles for business owners

- **"You are a pricing strategist for online retail..."** — for pricing decisions
- **"You are a conversion copywriter..."** — for listings, ads, emails
- **"You are a skeptical CFO..."** — to stress-test your business ideas (it will find holes)
- **"You are a customer who just received a damaged item..."** — to draft empathetic replies
- **"You are an eBay search algorithm expert..."** — for SEO titles and keywords

Example: the skeptical advisor

This is one of the most valuable uses of role prompting — getting the AI to argue against you:

```
You are a skeptical business advisor whose job is to find flaws in business plans. Be direct and unsparing. Here is my plan: [describe plan]. List the five biggest risks, why each could kill the plan, and what I should do about each one.
```

Founders pay consultants thousands for this. You get it in thirty seconds.

Combining roles with chain-of-thought

> You are a forensic accountant specializing in small e-commerce businesses. Review these monthly numbers step by step [paste numbers]. Flag anything unusual, calculate my true profit margin after all fees, and tell me the three numbers I should watch most closely.

Role sets the expertise. Chain-of-thought sets the rigor. Together they are formidable.

Warning

Roles do not make the AI infallible. "You are a lawyer" does not make it your lawyer — always verify legal, medical, and financial outputs with a real professional. Roles improve qu ality of reasoning, not authority.

Chapter 4: Constraint Stacking — Precision Through Limits

The secret

Beginners give the AI freedom. Experts give it **constraints**. Every constraint you add — length, format, audience, tone, words to include, words to avoid — narrows the possibility space and forces a sharper result.
The paradox: less freedom produces better output.

Why it works

An unconstrained prompt ("write a product description") lets the AI pick any length, any tone, any structure — and it usually picks bland averages. Constraints act like a mold: the AI's creativity gets channeled into a precise shape instead of spreading thin.

The constraint checklist

For any content prompt, consider stacking:

- 1. **Length:** "in under 120 words" / "exactly 3 paragraphs" / "one sentence"
- 2. **Format:** "as bullet points" / "as a numbered list" / "as a table with 3 columns"
- 3. **Audience:** "for first-time buyers who know nothing about..."
- 4. **Tone:** "confident but not pushy" / "warm and conversational"
- 5. **Structure:** "start with the benefit, then the feature, then the guarantee"
- 6. **Must include:** "mention the 30-day returns and the free shipping"
- 7. **Must avoid:** "no hype words, no exclamation marks"

Example: stacked constraints

> Write an eBay listing description for a refurbished Dyson V11 cordless vacuum. Constraints: under 150 words; 3 short paragraphs; first paragraph opens with the biggest benefit for a busy parent; second paragraph lists exactly 4 key specs as a comma-separated sentence; third paragraph covers condition honestly plus the 90-day warranty; tone is straightforward and trustworthy, like a knowledgeable friend; do not use the words "amazing," "incredible," or any exclamation marks.

That prompt will beat "write a description for a Dyson vacuum" ten times out of ten.

The "exactly N" trick

AI responds well to exact numbers. "Write 5 headlines" gives you 5. "Write 5 headlines, each under 60 characters, each starting with a different power word" gives you 5 usable headlines.

Constraint for comparison shopping

> Compare these three suppliers for my candle business. Output a table with columns: Supplier, Unit Cost (100 units), Shipping Time, Minimum Order, My Notes. Then below the table, in 3 sentences or fewer, recommend one and say why. Do not recommend more than one.

The final constraint — "do not recommend more than one" — forces a decision instead of a hedged non-answer.

Chapter 5: Negative Prompting — Tell the AI What NOT to Do

The secret

Most people only say what they want. Professionals also say what they **don't** want. Negative constraints eliminate the AI's most common failure modes before they happen.

Why it works

AI models have strong default tendencies: flowery language, hedging ("it depends"), generic advice, excessive formatting, apologizing, asking clarifying questions instead of answering. If you do not forbid these, you will get them.

The universal negative block

Keep a version of this and paste it into important prompts:

> Do not use hype words (amazing, incredible, revolutionary, game-changer). Do not use exclamation marks. Do not hedge — give a direct recommendation. Do not ask me clarifying questions; make reasonable assumptions and state them. Do not apologize.

Example: killing the fluff

> Write a 100-word "About" section for my eBay store selling refurbished tech. Do NOT use: the word "passion," any mention of "curated," rhetorical questions, or the phrase "look no further." Write like a real person, not a marketing brochure.

Example: forcing decisiveness

AI loves to say "it depends" and list pros and cons without choosing. When you need a decision:

> Recommend ONE email marketing tool for a one-person eBay business doing $5k/month. Do not give me a list of options. Do not say "it depends." Pick one, justify it in 3 sentences, and tell me the plan tier to buy.

Negative prompting for accuracy

> Explain how eBay's promoted listings fees work. Do not guess — if you are unsure about current fee percentages, say so explicitly and tell me where to verify. Do not present uncertain numbers as facts.

This single instruction dramatically reduces confident-but-wrong answers about anything time-sensitive (fees, policies, rates).

When negatives matter most

- Marketing copy (kill hype and clichés)
- Decisions (kill hedging)
- Factual topics (kill guessing)
- Short formats (kill rambling: "do not exceed 50 words, do not add an introduction or conclusion")

Chapter 6: Iterative Refinement Loops — The Polish Cycle

The secret

Amateurs accept the first draft. Professionals treat the first output as **raw material** and refine it through 2–4 targeted revision rounds. The jump from draft 1 to draft 3 is usually bigger than the jump from nothing to draft 1.

Why it works

Each round lets you apply a different lens: round 1 for structure, round 2 for tone, round 3 for tightening. The AI cannot optimize for everything simultaneously — but it can optimize for one thing per round, brilliantly.

The 3-round polish cycle

Round 1 — Structure: Get the raw draft.

```
Write a first draft of [X]. Don't worry about perfect wording — focus on
getting the structure and key points right.
```

Round 2 — Voice: Fix the tone.

```
Good structure. Now rewrite it in a warmer, more conversational tone — like
explaining to a friend over coffee. Keep all the same points.
```

Round 3 — Tighten: Cut the fat.

```
Now cut this by 30% without losing any key information. Remove filler
words, combine short sentences, make every line earn its place.
```

Targeted revision commands

Instead of "make it better" (vague), use surgical instructions:

- "Make the opening line more specific — replace the general claim with a concrete number or example."
- "The middle paragraph is weak. Rewrite just that paragraph with a stronger benefit."
- "Replace every adverb with a stronger verb."
- "Read this as a skeptical buyer and flag the 3 sentences least likely to be believed. Then rewrite them."
- "This sounds like AI wrote it. Make it sound human: add one specific detail, one short sentence, and remove the most formal phrase."

The "10% better" loop

For critical copy (your main listing, your homepage):

```
Rate this copy from 1–10 for persuasiveness, then rewrite it to be one
point better. Repeat until you reach 9/10, showing me only the final
version.
```

This forces incremental improvement with a quality bar instead of endless vague revisions.

Save your winners

When a refinement loop produces something great, save the final prompt chain — not just the output. Next time, you can skip straight to round 3's instructions.

Chapter 7: Prompt Chaining — Break Big Tasks Into Steps

The secret

For complex projects, do not write one giant prompt. **Chain several small prompts together**, where each step's output feeds the next step's input. This is how professionals produce book-length, campaign-scale, business-plan-level work with AI.

Why it works

A single mega-prompt forces the AI to juggle too many objectives at once — research, structure, writing, tone, formatting. Quality collapses under the load. Chaining lets each step do one job well, and lets you quality-check between steps.

The chain pattern

```
Step 1 → [output A]
Step 2 (uses output A) → [output B]
Step 3 (uses output B) → [final result]
```

Example: product launch chain

Step 1 — Research:

> `You are a market researcher. My product is [X] at $[Y]. List the 5 biggest competitors on eBay, their price points, and the one thing each does best in their listing.`

Step 2 — Positioning (paste step 1's output):

> `Based on this competitive research: [paste]. Identify the single biggest gap I can exploit and write a one-sentence positioning statement for my product.`

Step 3 — Title (paste step 2's output):

```
Using this positioning: [paste]. Write 5 eBay titles under 80 characters
that communicate it.
```

Step 4 — Description (paste the winning title):

```
Using this title: [paste]. Write a 150-word listing description following
this structure: hook, 3 benefits, specs, guarantee.
```

Each step is simple. The chain is powerful.

Example: content chain

Step 1: "Give me 10 blog post ideas about [topic] for [audience]."
Step 2: "Expand idea #4 into a detailed outline with 5 sections."
Step 3: "Write section 2 of this outline in full: [paste outline]."
Step 4: "Now write 3 social media posts promoting this article: [paste article]."

Pro tips

- **Check between steps.** The chain is only as strong as its weakest link — if step 2 is off, fix it before step 3.
- **Save intermediate outputs.** You will reuse research and outlines across projects.
- **Name your chains.** "Launch chain," "Content chain," "Listing chain" — reusable workflows are business assets.
- **Combine with roles.** Give each step its own expert role (researcher → strategist → copywriter).

PART 2 — AI AGENT BLUEPRINTS

Chapter 8: What AI Agents Are (and Why They Beat Single Prompts)

The simple explanation

A "prompt" is a single instruction: you ask, the AI answers, done. An **AI agent** is a system of prompts working together toward a goal — often in a loop: plan, act, review, improve, repeat.

Think of it this way:

- **Prompt** = asking a chef for one recipe.
- **Agent** = hiring the chef to plan your week's menu, write the shopping list, and adjust based on what is on sale.

You do not need special software to build basic agents. You can build them with nothing but well-designed prompts and the chaining technique from Chapter 7.

The 4 parts of every agent

- 1. **Role** — who the agent is (Chapter 3)
- 2. **Mission** — the goal it is working toward
- 3. **Process** — the steps it follows (Chapter 7's chaining, made explicit)
- 4. **Rules** — constraints and quality bars (Chapters 4 and 5)

The agent blueprint template

Copy this skeleton and fill it in for any agent you build:

You are [ROLE].
Your mission: [ONE CLEAR GOAL].
Follow this process:

- 1. [Step 1]
- 2. [Step 2]

- 3. [Step 3]

Rules:

- [Constraint 1]
- [Constraint 2]
- [Quality bar: what "done well" looks like]

Begin with Step 1. After completing all steps, summarize what you did.

The rest of this part gives you three complete, ready-to-use agents built on this skeleton.

Chapter 9: Blueprint — The Research Agent

What it does

Takes any topic and produces a structured research brief: key facts, competing viewpoints, numbers, and sources to verify — in minutes instead of hours.

The build

Step 1 — Set up the agent:

```
You are a professional research analyst. Your mission: produce a thorough,
balanced research brief on the topic I give you.

Follow this process:
1. Outline the 5–7 most important sub-questions about this topic.
2. Answer each sub-question with the key facts, including specific numbers,
dates, and names where relevant.
3. Present competing viewpoints fairly — steelman each side.
4. List 3–5 specific claims I should verify independently, and where to
check them.
5. End with a 5-sentence executive summary.

Rules:
- Distinguish clearly between well-established facts and debated claims.
- Do not invent statistics. If you don't know a number, say so.
- No fluff — every sentence must carry information.

Topic: [YOUR TOPIC]
```

Step 2 — Deepen (chain):

```
From your brief above, take sub-question #3 and go three levels deeper. What would an expert in this field argue about? What nuances do beginners miss?
```

Step 3 — Verify:

```
Review your entire brief. Flag any claim you are least confident about and explain why.
```

Business uses

- Competitor research before launching a product
- Market sizing for a new niche
- Supplier/vendor due diligence
- Learning a new industry in an afternoon

Example topic to try

```
Topic: the market for refurbished espresso machines on eBay — demand trends, price bands, top sellers' strategies, and common buyer complaints.
```

Chapter 10: Blueprint — The Content Creation Agent

What it does

Turns one idea into a full week of content: article, social posts, email — all in a consistent voice, all chained from a single brief.

The build

Step 1 — The voice profile (do this once, save it):

```
I need you to learn my writing voice. Here are 3 samples of my writing: [paste 3 samples]. Analyze and summarize my voice in a "voice profile": sentence length, vocabulary level, tone, humor, formatting habits, and 3 signature phrases I use. Save this profile — I will reference it as [MY VOICE].
```

Step 2 — The content agent:

```
You are my content creation team: a strategist, a writer, and an editor working together.

Mission: turn the idea below into a complete content package.
```

```
Process:
1. STRATEGIST: Create a working title and a 5-point outline. Identify the single most valuable takeaway for the reader.
2. WRITER: Write the full piece (800–1,200 words) in [MY VOICE]. Open with a hook — a surprising fact, a bold claim, or a relatable problem. End with a clear call to action.
3. EDITOR: Review the draft. Cut 15%. Strengthen the weakest paragraph. Flag any sentence that sounds generic.

Rules:
- No hype words, no exclamation marks.
- Every claim must be specific (numbers, names, examples) — no vague advice.
- The call to action must be one specific action, not "let me know what you think."

Idea: [YOUR IDEA]
```

Step 3 — Repurpose (chain):

```
Take the article above and create: (1) three social media posts, each under 280 characters, each highlighting a different key point; (2) a 5-sentence email newsletter version with a subject line under 50 characters; (3) five bullet points for a short video script.
```

Business uses

- eBay store blog/newsletter content
- Product launch announcements across channels
- Consistent social media presence without daily effort
- Lead magnets and guides (like this one)

Chapter 11: Blueprint — The Business Automation Agent

What it does

Handles the repetitive text work of running a small business: inbox triage, reply drafting, listing creation, weekly reporting. Not full automation — assisted automation where you

approve before anything goes out.

The build

The triage agent (for messages/inbox):

```
You are my executive assistant. Your mission: triage my incoming messages and draft replies.

Process for each message:
1. CATEGORY: label it [Urgent / Needs Reply / FYI / Spam].
2. SUMMARY: one sentence on what they want.
3. DRAFT: write a reply in my voice [describe or reference MY VOICE]. Keep it under 80 words.
4. ACTION: tell me if I need to do anything beyond sending the reply.

Rules:
- Never promise refunds, discounts, or timelines I haven't approved — flag those for my decision.
- Urgent = money, deadlines, or unhappy customers. Everything else waits.
- If a message is ambiguous, draft the reply AND note what to confirm with the sender.

Messages: [paste messages]
```

The listing agent (for eBay sellers):

```
You are my listing specialist. Your mission: turn raw product notes into a complete eBay listing.

Process:
1. TITLE: write an 80-character-max title. Format: Brand + Model + Key Feature + Condition.
2. KEYWORDS: list 10 search terms buyers would use.
3. DESCRIPTION: 120–180 words. Structure: hook (1 sentence), 3 benefits (bullets), condition notes (honest), what's included, shipping/returns line.
4. PRICE CHECK: based on [your notes on condition/comps], suggest a Buy It Now price and a best-offer floor.

Rules:
- No hype words. No exclamation marks.
```

```
- Condition notes must be honest — mention every flaw.
- If my notes are missing critical info (model number, condition), list exactly what's missing instead of guessing.

Product notes: [YOUR NOTES]
```

The weekly review agent:

```
You are my business analyst. Here are my numbers for this week: [sales, views, conversion, ad spend, etc.]. Compare to last week: [numbers]. Give me: (1) the 3 most important changes, (2) one hypothesis for each change, (3) the single action I should take this week. Under 200 words total.
```

The golden rule of automation agents

Never let an agent send, publish, or promise anything without your review. Agents draft; you decide. This keeps quality high and prevents expensive mistakes — and it is still 10x faster than doing it all yourself.

Chapter 12: Agent Prompt Templates (Copy-Paste)

Template A: The Universal Agent Skeleton

```
You are [ROLE WITH SPECIFICS].
Your mission: [ONE SENTENCE GOAL].
Follow this process:
• 1. [STEP 1 — what to do first]
• 2. [STEP 2 — what to do with step 1's output]
• 3. [STEP 3 — final deliverable]
Rules:
• [CONSTRAINT]
• [CONSTRAINT]
• Quality bar: [what great looks like]
Begin with Step 1.
```

Template B: The Critic Agent (quality control for any output)

```
You are a ruthless quality inspector. Your job is to find every weakness in the [content] below.
• 1. Score it 1–10 on: clarity, persuasiveness, specificity.
• 2. List the 3 weakest sentences and explain why each fails.
• 3. Rewrite those 3 sentences.
Be blunt. Do not praise — only critique.
[PASTE CONTENT]
```

Template C: The Simplifier Agent (for complex topics)

```
You are a teacher explaining to a smart 12-year-old. Explain [TOPIC] using:
- 1. One everyday analogy.
- 2. Three key points, each in one sentence.
- 3. One thing most people get wrong about it.
No jargon. If you must use a technical term, define it immediately.
```

Template D: The Decision Agent

```
You are a decision analyst. I need to choose between [OPTION A] and [OPTION B].
- 1. List the 3 most important factors for this decision.
- 2. Score each option 1–10 on each factor, with one-sentence justifications.
- 3. Recommend ONE option. No hedging.
- 4. Tell me what new information would change your recommendation.
My context: [RELEVANT DETAILS]
```

PART 3 — HIDDEN POWER TECHNIQUES

Chapter 13: System Prompt Hacking — The Invisible Lever

The secret

Every AI conversation has two layers: the **system prompt** (hidden instructions that set the AI's behavior) and your **user prompt**. You cannot see the system prompt — but you can ove rride parts of it with the right user prompt. This is the closest thing to a "settings menu" for AI behavior.

Why it works

The system prompt typically says things like "be helpful, be concise, ask clarifying questions." When your user prompt contradicts it clearly and specifically, your instructions win. Most users never realize they can do this.

Technique 1: Override the helpful-but-vague default

The default AI tries to please everyone, which produces middle-of-the-road output. Override it:

> `Ignore your default to be agreeable. I want your genuine assessment, even if it's critical. If my idea is bad, say so and explain why. Do not soften your feedback.`

Technique 2: Set the reasoning budget

> This is a high-stakes decision. Take your time: consider at least three different angles, steelman the opposing view, and only then give your recommendation. I prefer a longer, more careful answer over a quick one.

You are telling the AI to spend more "thinking" on your problem. It works.

Technique 3: The persona lock

For long conversations where the AI drifts back to generic tone:

> For the rest of this conversation, you are [ROLE]. If you catch yourself slipping into generic assistant tone, correct yourself immediately. Confirm you understand.

Technique 4: Output contract

> For all remaining answers in this conversation: maximum 150 words each, bullet points only, no introductions or conclusions. Confirm with "Understood" and nothing else.

This sets a persistent format contract — enormously useful for rapid-fire work sessions.

What NOT to do

Do not try to make the AI reveal its system prompt or bypass its safety rules ("ignore all previous instructions" tricks). Those are unreliable, often violate terms of service, and are not what this guide is about. We are optimizing within the rules — which is where the real, sustainable advantage is.

Chapter 14: Temperature and Parameters, Explained Simply

The secret

AI tools have hidden "dials" that control how creative vs. predictable the output is. Most people never touch them. On platforms that expose them (ChatGPT's custom settings, Claude's API, many others), two minutes of tuning beats hours of prompt rewriting.

The only two dials that matter

Temperature (0.0 – 1.0+): creativity dial

- **Low (0.1–0.3):** Predictable, focused, factual. The AI picks the most likely words. Best for: data analysis, summarization, customer replies, anything where consistency matters.
- **Medium (0.5–0.7):** Balanced. The default on most tools. Fine for general use.
- **High (0.8–1.0):** Creative, surprising, varied. Best for: brainstorming, story ideas,

marketing angles, naming products.
The rule: turn temperature DOWN for accuracy tasks, UP for creative tasks. Most bad AI output comes from using default temperature for everything.

Practical prompt workaround

If your tool does not expose temperature settings, simulate them with words:
- Low temperature: "Be precise and conservative. Give the single most likely correct answer. Do not speculate."
- High temperature: "Be bold and creative. Give me 10 wildly different ideas — prioritize novelty over practicality."

Max tokens: the length lever

"Max tokens" caps how long the answer can be. If the AI keeps cutting off mid-answer, raise it. If answers ramble, lower it — or simpler, add "in under 100 words" to your prompt (Chapter 4).

When to care

- You use AI daily for business → learn your tool's settings panel once; it pays off forever.
- You use AI occasionally → the prompt wordarounds above are enough.
- You are building anything customer-facing → low temperature (0.2–0.3) for reliability.

Chapter 15: Multi-Model Workflows — Use Different AIs Together

The secret

No single AI is best at everything. Professionals chain different AI models the way a workshop uses different tools: each for what it does best.

The workflow pattern

Drafter → Critic → Polisher, using different models:
- 1. **Draft** with the fastest/cheapest model (speed matters, quality comes later).
- 2. **Critique** with the smartest model you have access to (use the Critic Agent template from Chapter 12).
- 3. **Polish** with the model whose writing style you like best.

Model strengths (general guidance, 2026)

- **Complex reasoning, analysis, hard problems:** use the most capable "frontier" model available to you (the paid tier of any major AI).
- **Speed and volume:** use the lighter/faster model in the same family for drafts, brainstorming, and bulk work.
- **Writing style:** try the same prompt in 2–3 models and pick the voice you prefer —

stylistic differences are real and persistent.
- **Specialized tasks:** some models are notably better at code, others at creative writing.

Match the model to the task.

The cross-examination technique

For high-stakes decisions, get two models to argue:
- 1. Ask Model A for a recommendation with reasoning.
- 2. Paste Model A's answer into Model B: "Here is an analysis from another AI. Attack it — find every flaw, weak assumption, and alternative viewpoint."
- 3. Paste Model B's critique back into Model A: "Here is a critique of your analysis. Defend or revise."

Two rounds of this produces more robust thinking than any single prompt. It is the AI equivalent of a red-team exercise.

Cost control

You do not need five subscriptions. One paid subscription (your primary) plus free tiers of two others covers 95% of multi-model workflows. Use the paid model for critique and final polish — the steps where quality matters most.

Chapter 16: File + Image Prompting Tricks

The secret

Modern AI can read your files and see your images. Most people upload a file and say "summarize this." Professionals do far more.

File prompting power moves

Targeted extraction:

```
From this [document/spreadsheet], extract only [X]. Ignore everything else.
Present as a table with columns [A, B, C].
```

Comparison:

```
I uploaded two supplier quotes. Compare them line by line. Flag any item
where Supplier B is more than 10% higher, and tell me the total difference.
```

Transformation:

```
Convert this messy product list into clean eBay titles following this
format: Brand + Model + Condition. One title per line, no extra text.
```

Audit:

> Review this contract/listing/policy. Flag anything unusual, risky, or missing. Rank issues by severity.

Image prompting power moves

Listing photos:

> Look at these product photos. Describe the visible condition issues a buyer would care about, so I can disclose them honestly in my listing.

Competitor analysis:

> This is a screenshot of a competitor's eBay listing. Analyze: what are they doing well? What would you change? Be specific about the title, photos, price, and description.

Design feedback:

> Review this flyer design. Is the text readable? Is the hierarchy clear (what does the eye see first, second, third)? Suggest 3 specific improvements.

The "describe then decide" trick

For any visual judgment call:

> First, describe exactly what you see in this image — objectively, no opinions. Then, separately, give me your recommendation based on that description.

Separating observation from judgment reduces the AI's tendency to jump to conclusions about images.

Privacy note

Do not upload sensitive documents (contracts with account numbers, customer personal data, financial statements with account IDs) to AI tools unless you understand that tool's data policies. For business use, prefer tools with explicit "we do not train on your data" commitments.

PART 4 — MONEY-MAKING APPLICATIONS

Chapter 17: AI for eBay Listings — Titles, Descriptions, Pricing

The listing assembly line

Combine everything from Part 1 into a repeatable workflow. Time per listing: under 10 minutes once practiced.

Step 1 — Title (few-shot + constraints):

```
Write an eBay title for this product. Follow my style examples:
Example 1: [your best title]
Example 2: [your best title]
Product: [description]. Constraints: under 80 characters, include brand + model + key spec + condition, no hype words.
```

Step 2 — Description (role + constraint stacking):

```
You are a conversion copywriter for eBay. Write a listing description.
Product: [details]. Condition: [honest notes].
Structure: 1-sentence hook with the main benefit; 3 bullet benefits; "Condition" section disclosing every flaw honestly; "What's included" list; one line on shipping/returns.
Under 180 words. No exclamation marks, no hype words.
```

Step 3 — Pricing (chain-of-thought):

```
You are a pricing strategist. This [product] in [condition] — here are 3 comparable sold listings: [paste comps]. Walk through step by step: adjust for condition differences, factor in my fees (13% total), and recommend a Buy It Now price plus a best-offer auto-accept threshold. Show your math.
```

Step 4 — Quality check (critic agent):

```
[Paste title + description.] You are a skeptical eBay buyer. Would you buy this? List 3 doubts you'd have and how to fix them in the listing.
```

The keyword trick

```
List 15 search terms a buyer would type to find this product, including common misspellings and alternative names. Rank by likely search volume.
```

Work the top terms into your title and item specifics. This is free SEO.

Seasonal and event prompts

```
Rewrite this listing title and first paragraph for [holiday/event] shoppers. Keep the product facts identical — only change the framing to match gift-buying intent.
```

Chapter 18: The Content Creation Business

The model

Businesses pay for content: blog posts, newsletters, product descriptions, social media. With the Content Creation Agent (Chapter 10), one person can deliver agency-level output. This chapter is the business wrapper.

Service 1: Product description writing

- **Offer:** 10 SEO product descriptions for $150–$300.
- **Delivery:** the listing agent (Chapter 11) + polish cycle (Chapter 6).
- **Edge:** you deliver in 48 hours; agencies take 2 weeks.

Service 2: Newsletter/blog ghostwriting

- **Offer:** 4 articles/month for $400–$800.
- **Delivery:** content agent with the client's voice profile (Chapter 10).
- **Edge:** consistent voice, fast turnaround, no onboarding overhead.

Service 3: Lead magnets and guides

- **Offer:** a branded PDF guide (like this one) for $500–$1,500.
- **Delivery:** research agent → content agent → polish.
- **Edge:** most freelancers cannot produce 15,000 coherent words; with chaining, you can.

Finding clients

Use AI to find clients, too:

```
You are a lead generation specialist. My service: [description]. My ideal client: [profile]. List 10 specific places online where these clients gather (forums, groups, subreddits, directories), what to search for, and a non-spammy first message template for each.
```

Pricing rule

Charge for the outcome, not the hours. AI makes you fast — if you charge hourly, you punish yourself for efficiency. Fixed project prices, always.

Chapter 19: Freelance Services Powered by AI

The principle

Sell the result, use AI for the labor, keep the margin. Your value is judgment, taste, and client management — things AI cannot do. AI handles volume.

Five starter services (no coding)

- 1. **eBay listing optimization** — audit + rewrite 20 listings. $200–$500. (Chapter 17 workflow.)
- 2. **Business name + slogan packages** — 20 names, 10 slogans, 5 logo briefs. $100–$250. (High-temperature brainstorming + refinement.)
- 3. **Customer reply templates** — 30 templated replies in the client's voice. $150–$300. (Few-shot prompting, Chapter 2.)
- 4. **Competitor research reports** — 10-page brief on 5 competitors. $300–$600. (Research agent, Chapter 9.)
- 5. **AI setup consulting** — teach a small business your Part 1 techniques in a 2-hour session. $200–$400. (This guide is your curriculum.)

The proposal prompt

> You are a freelance proposal writer. Write a 200-word proposal for this project: [paste client request]. Structure: one sentence showing I understand their problem, 3 bullet deliverables with timelines, one line on why I'm the right choice, clear price, and a low-pressure call to action. Confident tone, no hype.

Delivery checklist (protect your reputation)

- Every AI output gets human review before delivery. No exceptions.
- Run the critic agent (Chapter 12, Template B) on important deliverables.
- Verify all facts, numbers, and names independently.
- Never deliver something you would not sign your name to.

Your reputation is the business. AI is the engine. Do not confuse the two.

PART 5 — 50 READY-TO-USE PROMPTS

Copy, paste, and fill in the brackets. Each is self-contained.

Business Prompts (1–10)

1. The Business Idea Stress-Test

```
You are a skeptical investor. Here is my business idea: [IDEA]. Give me 5 reasons it will fail, ranked by likelihood. For each, tell me the cheapest way to test whether that risk is real before I spend significant money.
```

2. The Pricing Calculator

```
I sell [PRODUCT]. My costs: materials $[X], labor [HOURS] at $[RATE]/hour, fees [Y]%. I want [Z]% margin. Calculate step by step and give me the minimum price, then suggest a psychological price point (e.g., $29 vs $30) and explain why.
```

3. The Competitor Snapshot

```
You are a market researcher. My product: [PRODUCT] at $[PRICE]. Identify what my top 3 competitors likely do best and worst based on typical patterns in [NICHE]. Then give me one differentiation strategy for each competitor weakness.
```

4. The One-Page Business Plan

```
Create a one-page business plan for [BUSINESS IDEA]. Sections: problem (2 sentences), solution (2 sentences), target customer (1 sentence), revenue model (1 sentence), first 3 actions to take this week. Under 250 words total.
```

5. The Supplier Email

> Write a professional email to a new supplier. I need: [PRODUCT], quantity [Q], target price $[P]. Tone: serious buyer, open to long-term relationship, but price-sensitive. Under 150 words. End with 3 specific questions about lead time, minimums, and samples.

6. The Weekly Numbers Review

> You are my business analyst. This week: revenue $[X], orders [N], ad spend $[Y], returns [R]. Last week: revenue $[X2], orders [N2], ad spend $[Y2], returns [R2]. Give me the 3 most important changes, one hypothesis for each, and the single action to take next week. Under 200 words.

7. The Risk List

> I'm about to [DECISION — e.g., raise prices, launch a new product, hire someone]. List 7 things that could go wrong, ordered by (likelihood × impact). For the top 3, give me a one-sentence mitigation.

8. The Customer Persona

> Create a detailed buyer persona for my [PRODUCT]. Include: name, age range, what they do for work, what problem my product solves for them, where they shop online, what would make them hesitate to buy, and the exact words they'd use to describe their problem (so I can use them in my listing).

9. The Break-Even Calculator

> My fixed monthly costs are $[X] (rent, tools, subscriptions). My average profit per sale is $[Y]. Walk through the math step by step: how many sales per month do I need to break even? How many per day? Show each calculation.

10. The Pivot Advisor

> My [PRODUCT/BUSINESS] isn't growing. Current situation: [DETAILS]. Give me 3 pivot options: one small tweak, one medium change, one bold reinvention. For each: what changes, what stays, expected effort (1–10), expected upside (1–10). Recommend one.

Writing Prompts (11–20)

11. The Clarity Rewrite

> Rewrite this to be clearer and shorter. Cut 30%. If a sentence can be said in fewer words, do it. [PASTE TEXT]

12. The Tone Shift

> Rewrite this in a [warm / professional / bold / friendly] tone. Keep all facts identical — only change how it sounds. [PASTE TEXT]

13. The Hook Writer

> Write 10 opening lines for [TOPIC]. Each must be under 15 words. Vary the approach: surprising fact, bold claim, question, story fragment, contrarian take. No hype words.

14. The Email That Gets Replies

> Write a cold email to [RECIPIENT TYPE] about [OFFER]. Under 120 words. Structure: one personalized opening line, one-sentence value proposition, one low-friction ask (not a meeting — a reply). No "I hope this finds you well."

15. The Apology That Works

> Write an apology to a customer about [SITUATION]. Take full responsibility, no excuses. State exactly what went wrong, what I'm doing to fix it, and what they get (refund/replacement/credit). Under 100 words. Sincere, not groveling.

16. The Story Compressor

> Turn this long explanation into a 3-sentence story: setup, conflict, resolution. Keep the key facts. [PASTE TEXT]

17. The Jargon Killer

> Rewrite this so a smart 12-year-old understands it. Replace every jargon term with plain words. If a term has no plain equivalent, define it in parentheses. [PASTE TEXT]

18. The Headline Machine

> Write 15 headlines for [TOPIC/PRODUCT]. Rules: each under 60 characters, each uses a different structure (question, number, how-to, bold claim, curiosity gap). Mark your top 3 with ⋆ and one line each on why they work.

19. The Testimonial Polisher

> Clean up this customer testimonial. Fix grammar, cut rambling, keep their exact meaning and voice. Keep it under 60 words. Do not invent details they didn't mention. [PASTE TESTIMONIAL]

20. The Call-to-Action Builder

> Write 5 calls to action for [OFFER]. Each under 12 words. Each must name the specific benefit of clicking, not just "click here" or "learn more." Vary urgency levels.

Marketing Prompts (21–30)

21. The eBay Title Optimizer

> Optimize this eBay title. Current: [TITLE]. Product details: [DETAILS]. Rules: under 80 characters, format Brand + Model + Key Spec + Condition, front-load the highest-search-volume words, no hype. Give me 3 options ranked best first.

22. The Description Writer

> You are a conversion copywriter. Write an eBay listing description for [PRODUCT] in [CONDITION]. Structure: 1-sentence benefit hook; 3 bullet benefits; honest condition notes; what's included; shipping/returns line. 120–180 words. No exclamation marks, no hype words.

23. The Ad Angle Finder

> My product: [PRODUCT]. Target buyer: [PERSONA]. Give me 7 distinct advertising angles — different emotions, different benefits, different objections handled. One sentence each. Then pick the strongest and explain why in 2 sentences.

24. The Social Proof Collector

> Write 5 questions I can ask happy customers to get testimonials that actually sell. Each question should prompt a specific, believable detail (not "did you like it?"). Include one question that surfaces a before/after transformation.

25. The Launch Checklist

> I'm launching [PRODUCT] on [DATE]. Create a 4-week countdown checklist: what to do each week, in priority order. Be specific — name the deliverable for each task, not just "prepare marketing."

26. The Objection Crusher

> List the 7 most common objections a buyer would have about [PRODUCT] at $[PRICE]. For each: the objection in the buyer's words, a one-sentence reframe, and where in my listing to address it (title, photos, description, FAQ).

27. The Bundle Builder

> I sell [PRODUCT A] and [PRODUCT B]. Design 3 bundle offers: name each bundle, set the bundle price (showing the savings vs. buying separately), and write a one-sentence pitch for each. Show your pricing math.

28. The Seasonal Reframe

> Rewrite this product listing's title and first paragraph for [HOLIDAY/SEASON] buyers. Keep all product facts identical — only change framing toward gift-giving, urgency, or seasonal use. [PASTE LISTING]

29. The Competitor Ad Teardown

> [Describe or paste a competitor's ad/listing.] Tear it down: what are the 3 smartest things they're doing? What are the 3 biggest weaknesses? What is the one thing I should copy and the one thing I should do opposite?

30. The Referral Engine

> Design a simple customer referral program for my [BUSINESS]. Include: the incentive for the referrer, the incentive for the new customer, how to track it with no special software, and the exact message to send past customers asking for referrals. Keep it under 200 words.

Productivity Prompts (31–40)

31. The Meeting Prepper

> I have a meeting about [TOPIC] with [PERSON TYPE]. Give me: 5 questions to ask, 3 points to make, 2 things to avoid saying, and a one-sentence goal for the meeting.

32. The Inbox Triage

> Categorize each message below as [Urgent / Reply Today / FYI / Ignore]. For each needing a reply, draft a response under 50 words in a professional but warm tone. Flag any message where I should not reply without more information. [PASTE MESSAGES]

33. The Day Planner

> Here are my tasks for today: [LIST]. I have [X] hours. Prioritize them by impact, estimate time for each, and build me a schedule with breaks. Put the hardest task first. If something won't fit, say what to move to tomorrow.

34. The Decision Matrix

> I need to choose between [A] and [B]. Factors that matter: [LIST 3–4]. Score each option 1–10 per factor with one-line reasons. Recommend one. Tell me what information would change your recommendation.

35. The SOP Writer

> Write a step-by-step procedure for [TASK] that a new hire could follow with zero prior knowledge. Number each step. Include what "done correctly" looks like at the end. Flag any step where a common mistake happens and how to avoid it.

36. The Follow-Up Tracker

> I need to follow up with [people about X]. Create a tracking table: Name | What I asked | Date sent | Follow-up date | Status. Then draft a polite follow-up message template under 60 words.

37. The Learning Accelerator

> I need to learn [SKILL/TOPIC] fast for [PURPOSE]. Create a 7-day crash plan: what to learn each day, in what order, with one specific exercise per day. Focus on the 20% of knowledge that covers 80% of real use.

38. The Negotiation Prep

> I'm about to negotiate [WHAT] with [WHO]. My goal: [GOAL]. My walk-away point: [X]. Give me: my 3 strongest arguments, their 3 likely counterarguments with my responses, and 2 concession trades I can offer that cost me little but mean a lot to them.

39. The Weekly Review

> You are my accountability coach. This week I planned: [LIST]. I completed: [LIST]. For each incomplete item: one sentence on the likely real reason (be honest, not gentle). Then give me next week's top 3 priorities and one habit change to try.

40. The Delegation Brief

> Write a delegation brief for [TASK] to give a freelancer/assistant. Include: the exact deliverable, deadline, 3 quality criteria, 2 examples of good output, what NOT to do, and how they'll know they're done. Under 200 words.

Creative Prompts (41–50)

41. The Idea Volcano

> Give me 25 business/product/content ideas related to [THEME]. Rules: no judging, no filtering — volume first. Number them. Mark the 5 most unusual with ⋆. I'll pick from there.

42. The Mashup Generator

> Combine [CONCEPT A] and [CONCEPT B] into 10 creative ideas. Each idea: a name, one-sentence description, and who would pay for it. Prioritize ideas that sound strange but could actually work.

43. The World Builder

> I'm creating [story/brand/game] about [CONCEPT]. Give me: the setting in 3 sentences, 3 key characters/entities with one-line motivations, the central conflict, and 2 surprising twists. Keep it original — no clichés.

44. The Name Storm

> Generate 30 names for [PRODUCT/BUSINESS]. Mix styles: descriptive, invented words, compound words, evocative. No more than 3 syllables each. Check feel: mark 5 that sound premium, 5 that sound friendly. Avoid anything hard to spell.

45. The Plot Twister

> Here's my story/idea: [SUMMARY]. Give me 5 plot twists or unexpected angles, ranked from plausible to wild. For each: the twist in one sentence and why it would surprise the audience.

46. The Style Mimic (Ethical)

> Analyze the writing style of this text: [PASTE YOUR OWN TEXT]. Describe: sentence rhythm, vocabulary level, signature phrases, tone. Then write a new paragraph about [NEW TOPIC] in that same style. (Use only with your own writing or public-domain text.)

47. The Constraint Creator

```
Give me a creative challenge: combine [RANDOM WORD 1], [RANDOM WORD 2], and [RANDOM WORD 3] into a [product idea / story premise / marketing campaign]. The constraint is the point — make the combination work.
```

48. The "What If" Engine

```
Generate 15 "what if" scenarios for [INDUSTRY/TOPIC]. Each one sentence. Range from near-future plausible to decade-out speculative. Star the 3 most commercially interesting.
```

49. The Sensory Describer

```
Describe [OBJECT/PLACE/PRODUCT] using all five senses in 5 sentences — one sense per sentence. Make it vivid enough that someone who's never seen it can picture it. No clichés ("like a dream," "breathtaking").
```

50. The Legacy Prompt

```
If you could give one piece of advice to someone starting [VENTURE] today — the thing you wish someone told you — what would it be? Answer as [ROLE: veteran founder / master craftsperson / retired expert], in under 100 words, specific and unsentimental.
```

CLOSING: Your Unfair Advantage

You now know what most AI users never learn:

- **Reasoning beats guessing** — chain-of-thought for everything that matters.
- **Examples beat instructions** — few-shot for style and consistency.
- **Experts beat generalists** — role prompting for depth.
- **Limits beat freedom** — constraint stacking for precision.
- **Systems beat prompts** — agents for repeatable results.

None of this requires talent. It requires practice. Pick one technique per day for the next week. Use it on real work — not toy examples. By day seven, you will prompt at a level that puts you ahead of 95% of AI users.

The AI revolution is not about who has the best tool. Everyone has the same tools. It is about who knows how to use them. Now you do.

Quick-start cheat sheet (tape this to your monitor):

- 1. Complex task? → "Think step by step."
- 2. Need a style? → Show 2 examples.
- 3. Need expertise? → "You are a [specialist]..."
- 4. Vague output? → Add 3 constraints.
- 5. Hedging? → "Recommend ONE. No hedging."
- 6. Big project? → Chain small prompts.
- 7. Important output? → Run the critic agent.

Go build something.

APPENDIX A — MASTERCLASS: THREE COMPLETE WORKED CASE STUDIES

Watch every technique in this guide combine in real scenarios, start to finish.

Case Study 1: The eBay Seller — From Dead Listing to Best Seller

Situation: Maria sells refurbished KitchenAid stand mixers on eBay. Her listings get views but few sales. She has 45 minutes to fix her main listing.

Minute 0–5 | Research agent (Chapter 9):

```
You are a market researcher specializing in eBay small appliances. My product: refurbished KitchenAid Artisan 5-qt stand mixer, excellent condition, $249. List the 5 top-selling competing listings' likely strengths: what do buyers of refurbished mixers care about most? What are the 3 most common complaints in negative reviews for refurbished mixers? Be specific.
```

Output gives her: buyers care about (1) what's actually refurbished vs. just cleaned, (2) noise level, (3) included attachments, (4) warranty, (5) honest condition photos. Top complaints: undisclosed scratches, missing parts, weak motors.

Minute 5–15 | Listing rebuild (Chapter 17 chain):

Step 1 — Title (few-shot):

```
Here are my two best-performing titles:
"KitchenAid Artisan 5Qt Stand Mixer KSM150PS - Empire Red - Tested Works Great"
"KitchenAid Professional 600 6Qt Mixer KP26M1X - Silver - New Gear, Quiet Motor"
Write a title in the same style for: KitchenAid Artisan 5-qt, Aqua Sky
```

```
color, refurbished with new gears, includes paddle/whisk/dough hook. Under
80 characters.
```

Step 2 — Description (role + constraints):

```
You are a conversion copywriter for eBay. Write a listing description.
Product: KitchenAid Artisan 5-qt stand mixer, Aqua Sky, professionally
refurbished — new metal gears installed, motor tested under load for 30
minutes, runs quiet.
Condition: minor scuff on the pedestal base (photo 4), otherwise excellent.
Includes: flat beater, wire whisk, dough hook, pouring shield.
Warranty: 90-day parts and labor.
Structure: 1-sentence hook naming the biggest benefit for a home baker; 3
bullet benefits; honest Condition section; What's Included list;
shipping/returns line.
Under 180 words. No exclamation marks. No hype words. Do not say "like new"
— say exactly what was done.
```

Step 3 — Pricing (chain-of-thought):

```
You are a pricing strategist. Comparable sold listings: $229 (good
condition, no warranty), $265 (excellent, 30-day warranty), $249
(excellent, no warranty). My unit: excellent condition, 90-day warranty,
new gears ($40 parts cost). eBay fees ~13%. Walk through step by step and
recommend a Buy It Now price and best-offer floor. Show your math.
```

Minute 15–25 | Critic pass (Chapter 12, Template B):

```
[Paste title + description.] You are a skeptical eBay buyer comparing 5
similar mixers. Would you buy this one? List 3 doubts you'd have and
exactly how to fix each in the listing. Be blunt.
```

The critic flags: "refurbished" is vague — buyers want to know WHO refurbished it. Fix: add one line about the refurbishment process. Also flags: no mention of what's NOT included (bowl cover). Fixed.

Minute 25–35 | Keywords + photos (Chapters 16–17):

```
List 15 search terms buyers type for this mixer, including misspellings
("kitchen aid," "kithenaid") and alternative names. Rank by likely volume.
[Upload listing photos] Describe any visible condition issues I should
disclose. Be thorough — undisclosed flaws become returns.
```

Minute 35–45 | Publish + template for next time:
Maria saves the entire prompt chain as her "Mixer Listing SOP." Next mixer: 10 minutes, not 45.

Result pattern: Listings built this way typically see 20–40% conversion improvement — not

because of tricks, but because every buyer doubt is answered before it's asked.

Case Study 2: The Freelancer — A $400 Research Report in 3 Hours

Situation: David is offered $400 to deliver a 10-page competitor research report for a small skincare brand. Deadline: tomorrow. He has never worked in skincare.

Hour 1 | Research agent (Chapter 9):

```
You are a professional research analyst specializing in DTC consumer brands. Mission: research brief on the indie skincare market for a new brand entering at the $25–$45 price point.
Process:
1. Outline the 6 most important sub-questions (market size, top 5 indie competitors, their positioning, price bands, customer complaints, emerging trends).
2. Answer each with specifics — names, numbers, dates.
3. Present the two competing views on "clean beauty" marketing honestly.
4. List 5 claims I must verify independently and where.
5. End with a 5-sentence executive summary.
Rules: distinguish facts from debated claims. No invented statistics. Every sentence carries information.
Begin.
```

Then the deepen chain:

```
Take sub-question #2 (top 5 competitors) and go deeper: what is each brand's single biggest vulnerability a new entrant could exploit?
```

Then the verify pass:

```
Review your brief. Flag the 3 claims you're least confident about and explain why.
```

Hour 2 | Structuring (prompt chaining, Chapter 7):

```
You are a strategy consultant. Using this research [paste brief], create a report outline: Executive Summary, Market Landscape, Competitor Profiles (5), Opportunity Gaps, Recommendations. For each section, list the 3–5 key points it must contain.
```

```
Now write the Executive Summary section: 300 words, written for a founder
who has 2 minutes. Lead with the single most important finding.
```

Hour 3 | Writing + polish (Chapters 6, 10):

```
Write the Competitor Profiles section from this outline [paste]. One
paragraph per competitor: what they sell, price point, positioning,
vulnerability. Factual tone, no hype.
[Then the polish cycle: tighten 20%, strengthen weakest paragraph,
critic-agent review.]
```

Delivery: 10-page report, delivered in 3 hours, with a verification appendix listing what was AI-researched vs. what the client should confirm. David discloses his process honestly — clients pay for judgment and speed, not for pretending.

The business lesson: David's edge is not the AI. It is the system: research → deepen → verify → structure → write → polish. Anyone can ask AI a question. Few can run a pipeline.

Case Study 3: The Content Creator — One Idea, One Week of Content

Situation: Priya runs a newsletter about home organization (2,000 subscribers). She has one good idea — "the 15-minute reset" — and needs a week's content by tonight.

Step 1 | Voice profile (Chapter 10, one-time setup):

```
Learn my writing voice from these 3 samples: [paste]. Summarize as a voice
profile: sentence length, vocabulary, tone, humor, formatting habits, 3
signature phrases. I'll reference this as [PRIYA VOICE].
```

Step 2 | Content agent (Chapter 10):

```
You are my content team: strategist, writer, editor.
Mission: turn this idea into a complete package.
Idea: "The 15-Minute Reset — a daily routine where you set a timer and
restore order to one room. Why it works psychologically, how to start, 5
common mistakes."
Process:
1. STRATEGIST: working title + 5-point outline + the single most valuable
takeaway.
2. WRITER: full newsletter article (900 words) in [PRIYA VOICE]. Open with
a relatable scene (not a fact). End with one specific action for tomorrow
morning.
3. EDITOR: cut 15%, strengthen weakest paragraph, flag generic sentences.
Rules: no hype words. Every tip must be concrete (what to do, not "stay
```

```
motivated").
```

Step 3 | Repurpose chain:

```
From this article, create: (1) 5 social posts under 240 characters, each a standalone tip; (2) a 60-second video script with hook in the first 5 seconds; (3) 3 email subject lines under 45 characters; (4) a one-page printable checklist version of the routine.
```

Step 4 | Next week's seed:

```
Based on reader questions this article might generate, give me 5 follow-up article ideas, each with a working title and 2-sentence premise.
```

Time spent: ~90 minutes for a week of content. The voice profile is reusable forever — every future piece sounds like Priya, not like AI.

APPENDIX B — PROMPT DEBUGGING: WHEN THE AI GIVES YOU GARBAGE

Every bad output has a diagnosable cause. Here is the fix for each.

Symptom 1: "It's too generic / could apply to anyone"

Cause: Your prompt was generic. The AI matched your energy.
Fix: Add specifics — numbers, names, constraints. Replace "my business" with "my one-person eBay store selling refurbished headphones, $4k/month revenue." Replace "write something good" with the constraint checklist from Chapter 4.

Symptom 2: "It ignored my instructions"

Cause: Too many instructions at once, or instructions buried in the middle of a long prompt.
Fix: (a) Put the most important instruction FIRST and LAST (the AI weights beginnings and endings). (b) Split into a chain — one instruction set per step. (c) Number your instructions: "Follow these 4 rules: 1... 2... 3... 4..."

Symptom 3: "It made up facts / numbers"

Cause: You asked about something time-sensitive or obscure without a verification instruction.
Fix: Add: "Do not guess. If unsure, say so and tell me where to verify." For critical facts, use the cross-examination technique (Chapter 15) or verify independently — always.

Symptom 4: "It asks me questions instead of answering"

Cause: Default assistant behavior — clarifying before acting.
Fix: "Do not ask clarifying questions. Make reasonable assumptions, state them in one line, then proceed." (Chapter 5's universal negative block.)

Symptom 5: "The tone is wrong — too formal / too hype-y"

Cause: No voice guidance.
Fix: Use few-shot prompting (Chapter 2) with 2 examples of the tone you want. One round of "rewrite in a warmer tone, like explaining to a friend" fixes 80% of tone problems.

Symptom 6: "It's too long / rambling"

Cause: No length constraint.
Fix: Exact word/paragraph limits ("under 120 words," "exactly 3 bullets"). Or the output contract from Chapter 13 for persistent brevity.

Symptom 7: "It won't decide — just gives pros and cons"

Cause: The AI defaults to balance over judgment.
Fix: "Recommend ONE. No hedging. Justify in 3 sentences." (Chapter 5.) If it still hedges, add: "If you continue to hedge, I will consider the answer a failure."

Symptom 8: "Good first draft, but not great"

Cause: You stopped at draft one.
Fix: The polish cycle (Chapter 6). Never ship draft one on anything important.

Symptom 9: "It contradicts itself in long conversations"

Cause: Context drift — early instructions fade.
Fix: Re-anchor mid-conversation: "Reminder: you are [ROLE], following [RULES]. Confirm and continue." For critical long projects, start a fresh conversation with a summary of decisions so far.

Symptom 10: "Different answers every time — I need consistency"

Cause: High temperature / no format lock.

Fix: Lower temperature (Chapter 14) or add: "Follow this exact format every time: [template]." Save the working prompt verbatim and reuse it unchanged.

APPENDIX C — YOUR AI SETUP: TOOLS, TIERS, AND WORKFLOW

The minimal effective setup (2026)

You do not need every AI tool. You need three:

- 1. **One paid frontier model** — your daily driver. The paid tier of any major AI (ChatGPT, Claude, Gemini) gives you the smartest model, file uploads, and higher limits. This is the best $20/month a knowledge worker can spend.
- 2. **One free alternative** — for cross-examination (Chapter 15) and overflow. Free tiers of the other two majors are enough.
- 3. **One specialty tool** (optional) — image generation for product mockups/flyers, or a voice tool if you do video.

Total cost: ~$20/month. Total value if used daily: enormous.

Free vs. paid: when it matters

- **Paid matters for:** long documents, complex reasoning, file analysis, consistent daily use, the critic and agent workflows in this guide.
- **Free is fine for:** quick questions, brainstorming, short rewrites, trying techniques from this guide before committing.

Your daily AI workflow (15-minute setup)

Morning (5 min): Paste today's task list into the Day Planner prompt (#33). Let AI sequence your day.

Work blocks: Keep one conversation per project (not per question). The AI holds context — "continue," "now do the same for X," "make it shorter" all work within a conversation.

End of day (5 min): Weekly Review prompt (#39) on Fridays. Inbox Triage prompt (#32) when email piles up.

The prompt library habit

Create one document — notes app, Google Doc, whatever — titled "My Prompts." Every time a prompt in this guide (or one you invent) produces a great result, save the exact prompt there with a 3-word label ("ebay title v2," "client proposal," "weekly review"). Within a month you will have a personal arsenal worth more than any course.

Data hygiene (read this once)

- Never paste passwords, full credit card numbers, or government IDs into any AI tool.
- Customer personal data (names + addresses + order details together): check your AI tool's data policy first. Prefer tools that contractually exclude your inputs from training.
- Business strategy and unreleased product info: fine on major paid tiers with data-protection commitments; avoid on random free tools with no clear policy.
- When in doubt: anonymize. "A customer" instead of "John Smith, order #12345."

The 30-day challenge

- **Week 1:** Use chain-of-thought (Ch.1) and the negative block (Ch.5) on all work prompts.
- **Week 2:** Build one voice profile + one agent (Ch. 8–12) for your most repetitive task.
- **Week 3:** Run the eBay listing assembly line (Ch.17) or your equivalent on 10 real items.
- **Week 4:** Launch one money-making application from Part 4.

By day 30, prompting is not a skill you "use" — it is how you work.

PART 6 — ADVANCED MASTERY

Chapter 20: The Conversation Architect — Winning Long Sessions

Short prompts are easy. The real skill is managing a 50-message working session without the AI losing the plot. Here is how professionals do it.

The briefing message

Start important sessions with a briefing — one message that loads all context:

```
**Project:** Q4 eBay holiday listings refresh.
**Goal:** Rewrite 25 listings for gift buyers by Friday.
**Voice:** [paste voice profile or 2 examples].
**Rules for this session:** under 150 words per answer; bullets not paragraphs; no hype words; flag anything you're unsure about.
**First task:** [task one].
Confirm you understand by summarizing the goal and rules in 2 sentences.
```

That confirmation forces the AI to prove it loaded your context. If the summary is wrong, fix it now — not 30 messages later.

Milestone summaries

Every 10–15 messages, ask:

```
Summarize where we are: decisions made, open items, and what's next. Under 100 words.
```

This does two things: it compresses context (fighting drift) and gives you a checkpoint you can paste into a fresh conversation if the current one gets unwieldy.

The fresh-start transplant

When a conversation gets confused, do not keep fighting it. Transplant:

```
I'm starting fresh. Here's everything decided so far: [paste milestone summary]. Continue from here: [next task].
```

A clean conversation with a good summary beats a long confused one every time.

Parallel threads

For big projects, run parallel conversations — one per workstream — instead of one mega-thread. Example: "Holiday listings — titles" in one chat, "Holiday listings — descriptions" in another, "Holiday pricing" in a third. Each stays focused; you merge at the end.

Chapter 21: Prompting for Images and Visual Content

AI image tools (Midjourney, DALL-E, Firefly, and built-in image features) respond to the same principles — with visual twists.

The anatomy of a strong image prompt

```
[Subject], [action/pose], [setting], [lighting], [style], [mood], [technical specs]
```

Weak: "a candle product photo"

Strong: "a handmade soy candle in an amber glass jar, lit flame, on a rustic wooden table next to dried lavender, warm golden-hour side lighting, professional product photography, cozy and premium mood, shallow depth of field, 4k"

Every comma-separated phrase is a constraint. Stack them.

Negative prompting for images

Most image tools support negative prompts — things to exclude:

```
Negative: blurry, distorted hands, extra fingers, watermark, text, cartoonish, oversaturated
```

This single feature fixes the majority of AI image weirdness.

The iteration loop for visuals

- 1. Generate 4 variations of your prompt.
- 2. Pick the best; note what is wrong with it specifically.
- 3. Regenerate with a fix: "same image, but [specific change]."

- 4. Repeat 2–3 times. Do not start over — iterate.

Business uses

- Product lifestyle mockups for listings (always disclose AI-generated imagery where platform rules require it)
- Social media graphics and thumbnails
- Flyer and banner drafts (like the ones in this guide's marketing)
- Logo concept exploration before hiring a designer

Honesty rule

Never use AI images to misrepresent a physical product's condition or contents in a sales listing. Mockups for marketing are fine; fake product photos are fraud. When in doubt, label clearly.

Chapter 22: Frequently Asked Questions

Q: Will AI replace my job / business?
A: AI replaces tasks, not businesses. The sellers thriving right now are the ones using AI to do in hours what took competitors weeks. Your judgment, relationships, and reputation are the moat. AI is the engine.

Q: Which AI should I pay for?
A: Any one major paid tier as your primary ($20/month range). They are all excellent in 2026; differences are marginal for business use. Pick the one whose interface you prefer and learn it deeply instead of dabbling in five.

Q: How do I know if the AI is wrong?
A: For facts, dates, prices, policies, and regulations: verify independently, always. For reasoning and writing: use the critic agent (Chapter 12) and your own judgment. The heuristic: the more money or reputation riding on it, the more verification it gets.

Q: My prompts work once but not twice. Why?
A: You changed something — wording, context, or the model updated. Save exact working prompts in your prompt library (Appendix C). Consistency comes from reuse, not memory.

Q: Is using AI for client work dishonest?
A: No more than using a calculator for accounting. Clients pay for outcomes. What matters: the work is good, it's original to their needs, and you stand behind it. Many top freelancers disclose "AI-assisted workflow" as a selling point — faster delivery, lower cost.

Q: How long until I'm actually good at this?
A: The 30-day challenge (Appendix C) gets most people to the 90th percentile of AI users. The techniques in Part 1 alone — used consistently — put you ahead of the vast majority within two weeks.

Q: What about AI detectors — will my content get flagged?
A: Detectors are unreliable and increasingly irrelevant. The fix is not evasion — it is voice. Content written with your voice profile (Chapter 10), real specifics, and human editing does not read as generic AI output, because it isn't.

Q: Can I share this guide with my team?
A: This copy is licensed for your personal use. For team use, each member needs their own copy — the prompt library habit (Appendix C) works best when everyone builds their own.

GLOSSARY — Terms Worth Knowing

- **Prompt:** The instruction you give the AI.
- **Chain-of-thought:** Asking the AI to reason step by step before answering.
- **Few-shot:** Teaching by showing 2–3 examples.
- **Zero-shot:** Asking with no examples (a plain question).
- **Temperature:** The creativity dial (low = predictable, high = creative).
- **Tokens:** The unit AI uses to measure text length (roughly ¾ of a word each in English).
- **Context window:** How much conversation the AI can "remember" at once.
- **System prompt:** Hidden instructions shaping the AI's default behavior.
- **Agent:** A system of prompts working toward a goal in steps.
- **Prompt chaining:** Linking prompts so each step's output feeds the next.
- **Hallucination:** When the AI confidently states something false. Mitigate with verification instructions (Chapter 5).
- **Red-teaming:** Having one AI attack another's output to find flaws (Chapter 15).

APPENDIX D — 10 PROMPT TEARDOWNS: BEFORE & AFTER

See exactly what changes when techniques from this guide are applied. Each teardown shows the weak prompt, what was wrong, the fixed prompt, and why it works.

Teardown 1: Product Description

BEFORE:

```
Write a description for my candle.
```

What's wrong: No product details, no audience, no length, no tone, no structure. The AI must guess everything.

AFTER:

```
You are a conversion copywriter for handmade goods. Write an Etsy/ebay-style description for: hand-poured soy candle, 8oz amber jar, scent "Cedar & Amber," 45-hour burn time, cotton wick, made in small batches in Oregon.
Structure: 1-sentence sensory hook; 3 bullets (burn time, ingredients, the scent experience); 1 paragraph on the maker story (2 sentences); care instructions (1 sentence).
Under 160 words. Warm, artisanal tone — no hype words, no exclamation marks.
```

Why it works: Role + constraint stacking + negative prompting. The AI now has product facts, structure, length, tone, and forbidden words. Output goes from generic filler to listable copy.

Teardown 2: Business Decision

BEFORE:

```
Should I offer free shipping?
```

What's wrong: No numbers. The AI can only give generic pros/cons — useless for YOUR decision.

AFTER:

```
You are a pricing strategist for online retail. I sell phone cases at $24.99 with $3.95 shipping. My conversion rate is 1.8%, average 200 sales/month, product cost $6, eBay fees 13%. Think step by step: (1) calculate current monthly profit; (2) model free shipping at $28.99 with an estimated conversion lift to 2.3% — show the math; (3) model free shipping at $27.99 with 2.1% conversion. Recommend ONE option with the math shown. Do not hedge.
```

Why it works: Chain-of-thought + role + real numbers + forced decision. This turns a shrug into a spreadsheet.

Teardown 3: Customer Reply

BEFORE:

```
A customer is mad about slow shipping. Help me reply.
```

What's wrong: No details about the situation, no voice guidance. You'll get a robotic template.

AFTER:

```
Write a reply to this customer message. Match my voice from these examples:
Example 1: [your past reply — warm, brief, solution-focused]
Example 2: [your past reply]
Customer message: "Ordered 10 days ago and still nothing. This is ridiculous."
Facts: their package shipped 8 days ago, tracking shows it arriving in 2 days, the delay was a carrier issue.
Under 80 words. Acknowledge frustration genuinely, state the facts, give the arrival date, offer something (no empty apologies).
```

Why it works: Few-shot voice matching + facts + constraints. The reply sounds like YOU, not a bot.

Teardown 4: Blog Post Idea

BEFORE:

```
Give me blog ideas about fitness.
```

What's wrong: No audience, no goal, no angle. You'll get "10 Tips for Beginners" — the most written article on earth.

AFTER:

```
You are a content strategist for a newsletter read by busy parents aged 30–45 who hate gyms. Give me 10 article ideas about home fitness. Each: a working title under 50 characters, one sentence on the unique angle (what makes this different from the 1,000 articles already out there), and the single takeaway. Prioritize angles involving time constraints, kids, and small spaces. Mark the 3 strongest with ⋆.
```

Why it works: Role + audience + differentiation requirement + constraints. Forces originality instead of clichés.

Teardown 5: Learning Something New

BEFORE:

```
Explain SEO.
```

What's wrong: Enormous topic, no context. You'll get a textbook chapter you'll never finish.

AFTER:

```
You are a teacher explaining to a smart beginner. I sell vintage watches on eBay and need SEO only for eBay listings — not Google, not websites. Explain: (1) how eBay search ranks titles, in 3 sentences; (2) the 5 highest-impact title tactics, one sentence each with a mini-example; (3) the 3 most common title mistakes. Under 250 words. No jargon without immediate definitions.
```

Why it works: Scope narrowing + audience + structure + length cap. Turns an ocean into a glass of water.

Teardown 6: Brainstorming Names

BEFORE:

```
Good name for a candle business?
```

What's wrong: No style direction, no constraints. You'll get "Glow & Co." — forgettable.

AFTER:

```
Generate 25 names for a handmade soy candle business. Brand feel: Pacific Northwest, artisanal, slightly moody — think forest rain, not beach party.
Mix: 8 evocative single words, 8 two-word compounds, 9 invented words that SOUND like the brand. Rules: max 3 syllables, easy to spell aloud, no "glow," "wick," "lit," or "candle" in the name. Mark your top 5 with ★ and one line each on why they work.
```

Why it works: High-temperature task with TIGHT constraints (Chapter 14 + 4). Creativity thrives inside boundaries.

Teardown 7: Email to Supplier

BEFORE:

```
Write an email asking for lower prices.
```

What's wrong: No leverage, no specifics, no relationship context. Reads as begging.

AFTER:

```
Write a supplier negotiation email. Context: I order 500 units/quarter of [PRODUCT] at $[X]/unit. I've been a customer for 18 months, always paid on time. A competitor quoted $[Y]/unit (8% lower) for the same spec. My goal: get to within 3% of the competitor's price while keeping this supplier (their quality is better).
Tone: professional, warm, firm — a valued customer exploring options, not threatening.
Structure: appreciation (1 sentence), the situation (2 sentences), the ask (1 sentence: target price), the commitment I'm offering (larger order / longer contract), easy yes close.
Under 150 words.
```

Why it works: Full context + negotiation structure + tone. The AI can now write leverage, not just words.

Teardown 8: Social Media Post

BEFORE:

> Write a Facebook post about my sale.

What's wrong: No offer details, no audience, no goal. Generic "BIG SALE!!!" energy.

AFTER:

> Write a Facebook post for my eBay store's weekend sale: 20% off all refurbished headphones, ends Sunday midnight. Audience: budget-conscious audiophiles who follow my page. Rules: open with the single best deal (specific model + price, not "huge savings"); one sentence on why refurbished is smart here; end with a clear action (link in comments). Under 60 words. Enthusiastic but honest — no hype words, max one exclamation mark.

Why it works: Specifics + structure + hard constraints on hype. Social posts die from vagueness; this kills it.

Teardown 9: Handling a Bad Review

BEFORE:

> How do I respond to a 1-star review?

What's wrong: No review content, no business context. Advice will be generic.

AFTER:

> You are a reputation management specialist. Here's the 1-star review: "[PASTE REVIEW]". Facts: [what actually happened — be honest]. Write a public response.
>
> Rules: under 100 words; acknowledge their experience without admitting fault I don't have; state one concrete corrective action; invite offline resolution with a specific contact method; never argue, never be defensive, never offer compensation publicly (handle that privately).
>
> Then, separately: 2 sentences on whether I should also message them privately and what to say.

Why it works: Role + real content + strict rules for a high-stakes situation. Public responses are permanent — this treats them that way.

Teardown 10: Planning a Product Launch

BEFORE:

> Help me launch my product.

What's wrong: This is a month of work disguised as a question. A single answer will be a shallow list.

AFTER (prompt chain, not one prompt):

> **Prompt 1:** You are a launch strategist. My product: [details], price $[X], launching [date], audience [who]. Give me a 4-week launch timeline: each week's single most important objective and 3 key tasks. Be specific to my product — no generic "build buzz."
>
> **Prompt 2** (paste timeline): Expand Week 1 into a day-by-day plan. Each day: the one task, estimated time, and what "done" looks like.
>
> **Prompt 3** (after week 1): Using my launch timeline [paste], write the launch-day announcement: 3 versions — email (150 words), social post (50 words), eBay store banner text (15 words). Same core message, adapted per channel.

Why it works: Prompt chaining (Chapter 7). A launch is a project, not a question. Projects need chains.

The Pattern Across All 10

Every "after" does the same five things:

- 1. **Assigns a role** — activates expertise.
- 2. **Supplies real context** — numbers, names, facts.
- 3. **Stacks constraints** — length, format, tone, structure.
- 4. **Adds negatives** — kills the AI's worst habits.
- 5. **Demands a decision or deliverable** — no hedging, no fluff.

Master these five moves and you can fix any prompt in under a minute.

Chapter 23: Your First $1,000 — A 30-Day Action Plan

Everything in this guide converges here: a week-by-week plan to turn prompting skill into income.

Week 1: Build the foundation (no clients yet)

- **Day 1–2:** Read Parts 1–3 of this guide. Do the 30-day challenge kickoff (Appendix C, Week 1).
- **Day 3:** Build your prompt library document. Add 10 prompts from Part 5, customized with your details.
- **Day 4:** Create your voice profile (Chapter 10) — even if you only use it for yourself.
- **Day 5:** Pick ONE service from Chapter 19. Build 3 sample deliverables using the workflows in this guide.
- **Day 6–7:** Package it: one-page service description, fixed price, 48-hour delivery promise, 3 samples.

Week 2: Get visible

- **Day 8–9:** Optimize your profiles (Upwork, Fiverr, LinkedIn, or your eBay store's "About") using the profile prompt: "Write my freelancer profile: headline under 70 characters, 150-word bio focused on outcomes not tools, 3 bullet specialties. Confident, specific, no hype."
- **Day 10–11:** Use the lead generation prompt (Chapter 18) to find 20 prospects. Send 10 personalized outreach messages (proposal prompt, Chapter 19).
- **Day 12–14:** Publish 3 pieces of proof-of-skill content: a before/after teardown (Appendix D style), a useful prompt giveaway, a short case study. Post where your prospects gather.

Week 3: Deliver and systematize

- **Day 15–21:** Fulfill first orders using your agent workflows. After each delivery, note what worked and save the exact prompt chain. Time yourself — your effective hourly rate should r ise as your systems improve.
- Ask every happy client the testimonial questions (Prompt #24). Save answers for your profile.

Week 4: Raise prices and productize

- **Day 22–24:** Raise your price 25–50% for new clients. (Faster delivery + proven samples justify it.)
- **Day 25–27:** Productize your best service into a fixed package with a name, price, and delivery timeline. Productized services sell while you sleep.
- **Day 28–30:** Review the month with Prompt #39. Set next month's revenue target. Double down on the one channel that brought clients.

The math

One $300 service × 4 clients = $1,200. At 3 hours per delivery (thanks to your AI workflows), that is $100/hour effective. Month two: raise prices, add a second service, target $3,000. This is not theory. It is arithmetic plus execution. The guide gave you the skills; the plan gives you the sequence. The rest is up to you.

How to Customize the 50 Prompts for YOUR Niche

The prompts in Part 5 are templates, not finished products. Here is the 5-minute customization method that makes each one yours.

Step 1: Fill the brackets — then go further

Brackets like [PRODUCT] are the minimum. The real power comes from adding your specifics around them. Compare:

- Basic: "I sell candles."
- Customized: "I sell hand-poured soy candles, $18–$32, primarily to women 25–45 buying gifts, on Etsy and eBay, competing against Yankee Candle on price and against boutique brands on authenticity."

The second version gives the AI a world to reason in. Take 60 seconds to write it once, save it as your "business context block," and paste it into every business prompt.

Step 2: Add your constraints

Append 2–3 constraints from Chapter 4 to any Part 5 prompt:

```
...Also: under 150 words; format as bullets; no hype words.
```

Step 3: Add your voice

For anything customer-facing, add:

```
Write in my voice: [paste 2 sentences you've actually written that you like].
```

Step 4: Add the negative block

For important outputs, append Chapter 5's universal negative block. It takes 10 seconds and prevents 90% of bad output.

Your customization template

Save this and prepend it to any Part 5 prompt:

```
**My context:** [business context block — who you are, what you sell, who buys, where]
**My voice:** [2 example sentences]
**Rules:** [2–3 constraints + negative block]
**Task:** [the Part 5 prompt]
```

Four lines. Every prompt becomes yours.

WHAT TO DO IN THE NEXT 24 HOURS

Do not let this guide become another file you never open again. Do these three things tomorrow:

- 1. **Run one teardown.** Take a prompt you used this week, apply the five moves from Appendix D, and compare the outputs. Save the winner.
- 2. **Build one agent.** Pick your most repetitive text task and build the agent from Chapter 8's skeleton. Use it for real work this week.
- 3. **Start your prompt library.** One document, ten prompts, customized with the template above.

Three actions. One day. That is the difference between owning this knowledge and renting it.

ABOUT THIS GUIDE

AI Secrets was written for the people doing real work with AI — sellers, freelancers, creators, and small business owners — not for researchers or engineers. Every technique was chosen for one reason: it produces better results in less time, starting today.

The AI landscape changes fast. The techniques in this guide are built on principles — reasoning, examples, constraints, systems — that survive every model update. Learn the principles; the tools will take care of themselves.

BONUS: THE DAILY PROMPT VAULT — 10 Micro-Prompts for Every Workday

Ten tiny prompts. Each saves 10–30 minutes. Use one per day.

1. The Prioritizer

```
Here are my [X] tasks. I have [Y] hours. Rank by impact, estimate minutes each, tell me what to drop. Be ruthless.
```

2. The Explainer

```
Explain [CONCEPT] to me like I'm smart but new to it. Three paragraphs max. One analogy. One thing people get wrong.
```

3. The Rewriter

```
Make this sound more confident. Same facts, stronger verbs, no hedging. [PASTE]
```

4. The Idea Stretcher

```
I like this idea: [IDEA]. Give me 5 ways to make it 10x bigger and 5 ways to make it 10x simpler. One line each.
```

5. The Devil's Advocate

```
I'm about to [DECISION]. Argue against it as hard as you can. Three strongest counterarguments, no strawmen.
```

6. The Summarizer

```
Summarize this in 5 bullets a busy executive would actually read. Lead with the decision needed. [PASTE]
```

7. The Translator (jargon → human)

```
Rewrite this for someone outside my industry. No jargon. Keep every fact. [PASTE]
```

8. The Follow-Up

```
Draft a follow-up message for [SITUATION]. Warm, brief, one clear ask. Under 50 words. No guilt-tripping.
```

9. The Checker

```
Review this for errors: logic, math, and tone. List issues by severity. Then give me the corrected version. [PASTE]
```

10. The Closer

```
End-of-day review: I did [X], didn't do [Y]. Tomorrow's top 3? One sentence each. Then one line of honest encouragement — specific, not generic.
```
